LAB 4 - CHAT HISTORY
Vibe Coding: Dino Run repair and feature implementation
Assigned source: SETAPESU26/36_dinoRun
Personal lab repository: Mirunjai/SE-Lab-1
Work date: 2 November 2026

1. CONVERSATION RECORD
User requested Lab 4 work in a Lab 4 folder in the personal repository, with:
- Before and after gameplay videos
- Updated code
- Exported AI chat history in DOC or PDF
User supplied the assigned repository URL.
Assistant inspected the assigned repository README and game.py.
The README describes one deliberate bug and three unfinished functions.
The README tasks were followed in their stated order.

2. TASK-BY-TASK IMPLEMENTATION PROMPTS
Task 1 - High-score bug
Correct the comparison in Game.update so the current run replaces the
saved best only when the current score is greater than the stored best.

Task 2 - Dino tint
Implement dino_tint(on_ground) with a distinct colour for the grounded
and airborne states.

Task 3 - Obstacle pass feedback
Implement on_obstacle_passed(obstacle, score) so a successful obstacle
clear is counted once and produces visible feedback.

Task 4 - Double jump
Implement max_jumps() to permit two jumps before the dino lands again.

3. IMPLEMENTATION SUMMARY
- High score: comparison changed to current > self.high_score.
- Dino tint: green while grounded, blue while airborne.
- Obstacle pass: increments a clear counter and displays a short popup
  containing the score when the obstacle was cleared. The passed flag
  prevents duplicate counting.
- Double jump: max_jumps() returns 2; landing resets jump_count.
- Added requirements.txt, test_game_features.py, README and a video guide.

4. VALIDATION AND EVIDENCE STATUS
Five dependency-free logic tests passed:
1) High-score update and protection against lower scores
2) Grounded and airborne tint values
3) One-time obstacle clear counting and popup timer
4) Two-jump limit
5) Landing resets the jump counter

Live Pygame gameplay was not verified in this execution environment.
Pygame was not installed, and the package index was unreachable when
installation was attempted. Therefore no genuine before/after gameplay
recordings were created here. No mock footage is being presented as proof.

Two genuine 10-second videos are still required:
- before.mp4: original game showing the broken high-score behavior
- after.mp4: corrected game showing tint, double jump, clear counter,
  and a high score that updates after a better run.

VIDEO_CAPTURE_GUIDE.md contains the steps to record these on a machine
with Pygame installed. The videos must be added to the Lab-4 folder.

5. REPOSITORY AND COMMITS
Changes are being made only in the personal repository, not the
SETAPESU26 source repository. Four separate commits implement the four
README tasks, followed by a documentation/tests commit.
No pull request was opened against the assigned organization repository.
